R83061-R83085, R8309-R83096 and R92907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of The peptides are administered to a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to administration for a limited period of time (compared to the lifetime modulate for a limited period of time (compared to the lifetime modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CILS) of the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           HLA-B2702 CTL modulating peptide (B2702.84-75(T)/75-84). 
Yytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Compsons. comprising lymphoid surface membrane proteins - which may inhibit cytolytic activity and differentiation of CTLs.

protein associated with T-cell activation in mammalian T-cells, and is
also immunologically cross reactive with the heat shock protein Hsc70.

p74 is found in a limited number of cell types, but is particularly expressed on B and T cells. p74 can be isolated by lysis of a suitable cell with an amphoteric detergent, and then passed through an affinity column containing a covalently bound HLA-B2702 palindromic peptide.

Compositions comprising the extracellular fragment of p74 combined with HLA-B2702.66-84 (see R95416), induces calcium influx, and inhibits cytotoxic T lymphocyte (CTL) differentiation or cytolysis. Candidate compounds can be screened for their effect on the cytolysis cativity of T-cells, by combining them with the extracellular portion of p74 and determining the amount of binding between the candidate compound and p74.

Modulation of CTL activity can be inhibited in a cellular composition containing T-cells and antigen presenting cells (APCs), by adding to the with p74 for the binding of the p74, in an amount sufficient to compete with p74 for the binding of the p74 ilgand.

Claim 16; Page 35: 41pp; English.

This sequence represents a specifically claimed immunomodulating dimer peptide of the invention. A peptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal acylated and/or C-terminal and dated or esterified forms of up to 60 amino acids, where the peptide-type compound comprises the formula; A-B, where A, B = (R aa76-77L) (aa39-84) or (aa84-7) (laa81-a884-a hydrophobic or small amino acid; aa82 - R or L; aa83 - G or R; and as represents annion acid. The sequence in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise amino acid sequences related to a class I HLA-B absent or truncated at any peptide type bond within the brackets. The compounds comprise amino acid sequences related to a class I HLA-B absent or truncated at any peptide type bond within the brackets. The compounds comprise amino acid sequences related to a class I HLA-B absent or truncated of a lass of a lass of a lass of a lass of linerast to activate CTLs. They can also inhibit the proteins of interest to activate CTLs. They can also inhibit the used for preventing rejection of transplants or for treating autoimmune diseases, e.g. diabetes, rheumatoid arthritis and lupus erythematosis.

The products can also be used for detection and diagnosis.

                                                              New peptide(s) based on Class I HLA antigen domains - used for modulating cytotoxic T-lymphocyte activity towards targets Claim 8; Page 53; 61pp; English.
The peptide (or a fragment of at least 10 amino acids, joined at at least one terminus to a sequence other than that of wild type HLA antigen) is used to modulate cytotoxic T-lymphocyte (CTL) activity, either by inhibition or stimulation. It can be used for inhibiting CTL toxicity in transplantations, for inducing CTL activity in parasitic diseases and neoplasia and in studies on viral infection. The peptide can also be used for identifying CTLs which beind to it and removing subsets of CTLs from a T-cell composition.
                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Mew peptide(s) based on class I HLA antigen domains - used for modulating cytotoxic T-lymphocyte activity towards targets Example 13; Page 39; 61pp; English.

Example 13; Page 39; 61pp; English.

The peptide is used to modulate cytotoxic T-lymphocyte (CTL) activity, either by inhibition or stimulation. It can be used for inhibiting CTL toxicity in transplantations, for inducing CTL infection. The peptide can also be used for identifying CTLs which bind to it and removing subsets of CTLs from a T-cell composition. This peptide is derived from the HLA-B38 antigen and corresponds Sequence 25 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                15-MAR-1994 (first entry)
Peptide fragment of HLA-1838 antigen.
Human leukocyte antigen; HLA; peptide; transplantation; neoplasia;

Claim 2; ppl1-12; 23pp; English.
The HLA class I DNA can be used a source of probes for use in DNA typing. Transformed cells, which are useful as immunogens, can be obtained by introducing these DNAs into eucaryotic cells.

Taxayoull m, and an anti- HLA antibodies prodn. - using Allotype specific monoclonal anti- HLA antibodies prodn. - using hybridoms derived from transgenic animals carrying HLA gene and immunised with HLA antigen of different allotype Disclosure; Fig 1 A-G; 20pp; English.

The human HLA-B51 gene was injected into fertilised mouse eggs and these introduced into the uterus of a pseudo pregnant mouse.

The young were tested to ensure incorporation of the gene into the chromosome, and one of them mated 3 times with a normal male to produce 16 young, seven of which carried the HLA-B51 gene.

The transgenet offspring were fused with HLA antigen.

The spleen lymphocytes were fused with myeloma cells. Hybridomas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         03-JAN'1991 (first entry)

P-PSDB: 10.20.5.
New isolated human genes
Claim 2; Page 126-129; 184pp; English.
This sequence represents a human gene of the invention, that is induced
This sequence represents a human gene of the invention, tesignated HCMV-inducible
genes (cig or cigs). The invention also relates to genes that are
repressed in the presence of HCMV infection, designated HCMV-repressible
genes (crg or crgs). The products can be used to obtain agents which can
be used for anti-viral therapy, particularly anti-HCMV therapy. They can
also be used for the development of drugs that would allow for higher
dosage IFN treatments without the concomitant toxicity normally
associated with administering high levels of IFN. The products can also
be used for detection, diagnosis and drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               30-707.)

Claim 1; Page 1; 11pp; Japanese.

Probes comprising part of the sequence can be used to identify class I genes. The DNA can be expressed for immunisation of animals and prodn. of monoclonal antibodies specific for the HIA-BW53 antigen. See also J03112485 and J03112486.

                                                                                                                                                                                                                                                                                                            The DNA may be used as a hybridisation probe for detecting the HLA B27 gene, e.g. for assessing susceptibility to rheumatic disorders such as anytylosis spondylitis, or may be used to transform cells for prodn. of HLA B27. The HLA B27 may be used to detect HLA B27 antibody in human serum, or to produce mono- or polyclonal HLA B27

DNA coding for human histocompatibility antigen HLA-B 27 - useful for diagnosis and antigen and antibody prodin.

Claim 1: p6: 13pp; German.

THe DNA may be used to detect the HLA-B 27 gene (opt. mutated) in human genetic material. The HLA-B 27 may be used to detect anti-HLA-B 27 antibodies in human serum. The antibodies may be used to determine HLA-B 27 levels in human serum, e.g. for diagnosis of rheumatic disorders, esp. ankylosing spondylitis.

Detecting pre-disposition to seronegative spondylarthropathies -
from the absence of a C residue at a specific position in the
finanting region of the HLA B27 allele
Claim 1; Page 52-56; 68pp; English,
Genetic predisposition to seronegative spondyloarthropathies (SNSA)
is detected by determining the absence of a cytosine nucleotide in
the 3' flanking region (see also T61647-48) of an HLA-B gene at a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /note= "3' flanking region diagnostic for genetic predisposition to SNSA"

Rapos1's sarcoma-associated herpes virus nucleic acid - encodes
di:hydro:folate reductase and is useful for treatment, prophylaxis
or diagnosis of Kapos1's sarcoma

PT or diagnosis of Kapos1's sarcoma

Disclosure; Column 125-156; 109pp; English.

This sequence is a fragment of the Kapos1's sarcoma-associated
herpesvirus (KSHV) LUR (long unique region). This fragment contains
coding regions for ORF54, ORF54, ORF56 which encodes a transactivator
(LCTP), K8, ORF52, ORF53, ORF54 which encodes durpase, ORF55, ORF56
which encodes DNA replication protein I, ORF57 which encodes immediated
carly protein II (IEP-II), K9 which encodes transactivator
crossembly/DNA maturation protein, ORF59 which encodes a samplication protein or semally rich encodes a large ribonucleotide reductase, ORF62 which encodes tegument protein II. KSHV is a new human

CI, ORF64 which encodes tegument protein III. KSHV is a new human
Herpesvirus (HHV8) believed to cause Kapos1's sarcoma (KS) which is the
most common form of neoplasm occurring in persons with adquired immune
deficiency syndrome (AIDS). The DHFR protein is useful for vaccination,
prophylaxis, diagnosis and treatment of a subject with Kapos1's sarcoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         KSHV LUR DNA (incleotides 70, 201-105,300).

Kaposi's sarcoma-associated herpesvirus.
position corresponding to nucleotide 4495 of the HLA-B27 consensus sequence given in T61639. Probes and primers (see also T61640-46) based on this region can be used in diagnostic assays to detect the genetic predisposition to SNSA, and permit the distinction of B274 individuals who are resistant to SNSA from B274 normal individuals who are resistant to such the distinction of B274 sequence 6553 BP; 1443 A; 1619 C; 2017 G; 1474 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ΰ

This sequence represents the long unique region and terminal repeat of

This sequence represents the long unique region and terminal repeat of

the Kaposi's sarcoma-associated herpes virus (KSHV), KSHV is also known

as human herpes virus 8 (HHV8). This sequence contains the DNAs of the

Invention which encode KSHV polypeptides selected from: (a) viral

CC (a) viral IRF 1; (d) complement-binding protein; glycoproteins B, M or L;

CC (c) viral IRF 1; (d) complement-binding protein; glycoproteins B, M or L;

CC (d) capsid protein IV encoded by ORF65; and (e) immediate early protein

CC (d) capsid protein IV encoded by ORF65; and (e) immediate early protein

CC (d) capsid protein; belied probes for the nucleic acid, proteins

CC (d) capsid protein IV encoded by ORF65; and (e) immediate early protein

CC (d) capsid protein antipodies (Aa)) specific for the proteins are useful for

CC (d) capsid protein and belied proteins can be treatment of HHV8 infection,

CC (d) capsid protein can be used for prophylaxis or treatment of HHV8 infection,

CC (d) fiferentiate between lymphomas, and HHV8 may be implicated in many

CC (d) differentiate between lymphomas, and HHV8 may be implicated in many

CC (a) differentiate between lymphomas, and animals containing the

CC (a) date used for antiviral drugs, e.g. dihydrofolate reductase gene

CC (a) deal manue status of a patient infected with HIV. HHV8 derived protein

CC (a) e.g. treating rheumatoid arthritis. This sequence is stated as containing

Detection and identification of organisms - using DNA primers to amplify signature segment of organism's type II topoisomerase Calaim 17-178; IIAPP; English.

A method has been produced for selectively amplifying DNA segments of one or more species of organisms in a sample. The method involves: (a) providing a database containing reference sequences, comprising a subunit sequence of a signature region of a macromolecule selected from a type II topoisomerase (Topoil), or a homoloque, where each reference sequence is specific to a different species of a chosen group, and the macromolecule comprises lst and 2nd conserved regions adjacently flanking the signature region; and (b) making an extract of DNA molecules, and selectively amplifying DNA segments of the signature constructed to bind a DNA encoding the macromolecule, to produce amplified DNA segments. The present sequence represents a DNA fragment constructed to bind a DNA encoding the macromolecule, to produce amplified DNA segments. The present sequence represents a DNA fragment constanting a signature sequence for Sphingomonas capaulatum. The method can be used to identify all of the different organisms present in a single sample without using multiple probes. It can accurately distinguish and similar and related species, and can be used with, e.g. contaminated food products, tissue or fluid samples from diseased humans, animal or plants, soil samples and water samples from any
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated human genes and the secreted polypeptides they encode - useful for diagnosis and treatment of e.g. neurological disorders. tumours, immune disorders, inflammation or haematological disorders

claim 1; Page 170; 215pp; English.

X51701-55 encode human secreted proteins. The polynucleotides and the teating or ameliorating medical conditions, e.g. by protein or generating or ameliorating medical conditions, e.g. by protein or generating or ameliorating medical conditions, e.g. by protein or generating or ameliorating medical conditions and iso be diagnosed by determining the macount of the new polyneptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are constructed for each polynucleotide, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, immune disorders, infection, inflammatory disorders, skin disorders, tumours, atherosclerosis, restenosis, autoimmune disorders, Alzheimer's disease, peripheral neuropathies, trauma, spinal cord injuries, allergy, hematopoietic disorders, skeletal disorders, neurological disorders, arthritic disorders, asthma, immunodeficiency disease, AIDS and transplant rejection. The polypeptides are also useful for identifying their beinging partners.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 1: Page 12; 11pp; English.

E.coli transformed with expression vectors contg this sequence produce BG at a high level (BG = 50% of total cellular protein).

The efficient BG promoter sequence can be placed upstream of DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /rpt_type=imperfect 26bp dyad
